

ADSL

**Faster data
transmission**

**Always
on**

**No
interruptions**

ADSL is a data communications technology that enables faster data transmission over copper telephone lines.

An ADSL broadband connection takes your existing copper phone line and adds a dedicated computer link between the telephone exchange and your home.

ADSL allows very cost effective, always on, high speed internet access.

Benefits

- It is connected 24/7, thus it is not necessary to pay dial up fees every time the customer gets connected to the internet
- The speed of ADSL is faster than that of a regular dial up connection. It allows for more data to be sent over an existing copper telephone line
- A customer cannot miss an important telephone call while connected to the internet; with ADSL one is able to receive calls while being on the internet at the same time
- Flat rate for internet access
